

SHELF LIFE CERTIFICATE

AEROSOL CANS

The shelf life of an aerosol can is the period during which we guarantee its intended performance, which is three years from the date of manufacture. This duration is determined by the propellant, not the product inside the can. Over time, the neoprene (rubber) valve gasket may deteriorate, potentially leading to a loss of pressure and making the product unusable. However, as long as the product can be sprayed, it remains usable. The contents are sealed inside the can, protecting them from contamination.

STORAGE

Proper storage is crucial to maintaining the propellant in aerosol cans, ensuring the product can be dispensed effectively. The ideal storage temperature range is between 50°F (10 °C) and 100°F (37.8°C). It is important to avoid freezing temperatures, temperatures above 120°F (49 °C), and prolonged exposure to direct sunlight.
